

and Layer 5 well withdrawals. GWB 5 is spring dominated, similar to GWB 3, with contributions from the surface flowing to Layer 3 spring discharge and 100% of all vertical flow to Layer 5 withdrawn from wells. GWB 6 is also spring dominated and less confined than GWB 5, which results in the vertical flows of water from the surface and from Layer 5 to make up spring discharge in Layer 3. GWB 7 is dominated by surface flows, as water from Layer 5 boundary heads flows upward to Layer 3 spring discharges and Layer 1 river and drainage boundaries. Details for each GWB are provided below.
